

Like Driving a Car – Troubleshooting

I still remember the moment that it clicked for me – a big part of our job is troubleshooting. Not just fixing something when it breaks, but reading into why it broke in the first place. How everything I learned individually is all tied together when working on machinery. Each machine is comprised of different components, in different ways, using different methods as needed for its process.

That can be a lot to take in. I think there is value in ‘planting seeds’. Tieng what we talked about today with something seemingly not related a couple weeks ago. As the course progresses, and I plant seeds for future courses, I hope they will see at their own right time, the interconnectivity of all the concepts we learn about.
