Enter your "Students" response:

The students have access to the technology. Microsoft Teams is available to everyone with the school account with their web browser. The institution supports any issue accessing their accounts at home, school or work. It should be available on their phones as well as computers. There are no special digital skills required as the UI and UX is fairly straightforward. There is no need to purchase the technology as it is included as being a student.

Enter your "Ease of Use" response

The technology is easy to use. If you have a browser or phone you can quickly learn it. It is easy to maintain as that is done by the institution. The moderating of the content is done by the instructor who is the owner of the channel. The provider is Microsoft. There should be offline copies of the standards for posting so that it can be easily replicated. The technical support is through the IM team.

Enter your "Cost" response

This technology is already accessible. A custom team must be created with the standards for using it which does not take long. The institution has a budget for each department if necessary but this technology would not need anything more. There is a team dedicated here to help properly design and implement new assessments and lessons. The resources used to help guide the creation of the discussion board are papers that discuss social media and healthcare that are freely available.

Your Teaching and Pedagogical Considerations response:

This technology supports learning outcomes for discussing and exploring the experiences of students in clinical. This technology allows the instructor to take each students perspective ahead of time and tailor the lesson after clinical to encompass all students. This helps pinpoint any successes and room for improvement from school to the workplace.

Your "Interaction" response:

The technology specifically facilitates one of the key aspects of the job which is communicating with the team and empathy with others including the patients through shared experiences. There is a week available for students to interact with each other and the instructor to help learn from each other.

Your "Organisational Issues" response:

The institution is key in providing access to the technology for all students. It is updated automatically when Microsoft does it so it is current. There are resources available for using any Microsoft products but our institution provides IM support for use of this as well if necessary. The current learning management system with appropriate procedures allow this to be done without a problem.

Your "Networking" response:

It is not important for learners to network with others outside this course. The technology does support this for more interaction if it is something to pilot. Any media sharing works as relevant files and links can be uploaded to the group.

Your Security and Privacy response:

The use of teams is private so only users invited to the Teams group can enter and post in the chat. The risk of privacy being breached is addressed by the rules of the group. Treat every post as if it is already public with no identifying information. The moderator and owner of the group which is the instructor allows this privacy to be maintained.
